

# QUORUM SITE

## Surveillance site configuration and management application

Quorum Site is part of the Quorum Pro suite of products and is a self-contained configuration application which works in conjunction with the Quorum Pro Client to provide comprehensive control and management of live and recorded video.

### Key Benefits

- Self-contained configuration application which provides effective management of small- and medium-sized video surveillance systems.
- Easy installation and operation - highly visual interface.
- Configure many servers and copy configuration between them.
- Auto-discovers available devices on the network making integration of multiple manufacturers' equipment quick and easy.
- Works in conjunction with the Quorum Pro client, Quorum Server, and Quorum NVR applications.
- Straightforward management of users, user groups, devices (including PTZ cameras), alarms, triggers, and recording jobs.
- Visualise your site by uploading maps created with the Quorum Design application.
- Configurable audit trail maintains a record of all user and system activity.

### Device Discovery

Adding devices to a site can be a long and tedious task, especially for large surveillance sites. Quorum Site provides a device discovery mechanism, which scans the network and lists discovered devices.

Alternatively, you can manually add devices, if preferred.

*Adding devices is a simple process. The device's type, suggested name, IP address and location details are automatically inserted by Quorum Site.*

### Audit Trail

Quorum Site's audit trail provides a comprehensive list of events that have occurred since the server component was installed. Events such as the following are logged:

- Alarms (acknowledged, closed).
- Users (added, deleted, edited etc.).
- Devices (added, updated, deleted, disconnected etc.).
- Recording (disk space low or critical).

You may want to focus on certain events. Audit trail profiles allow you to specify which events you want to display in the audit trail. Furthermore, events can be filtered according to event type and/or time. Audit trail reports in Adobe Acrobat PDF or .CSV format can then be generated from the filtered events list.

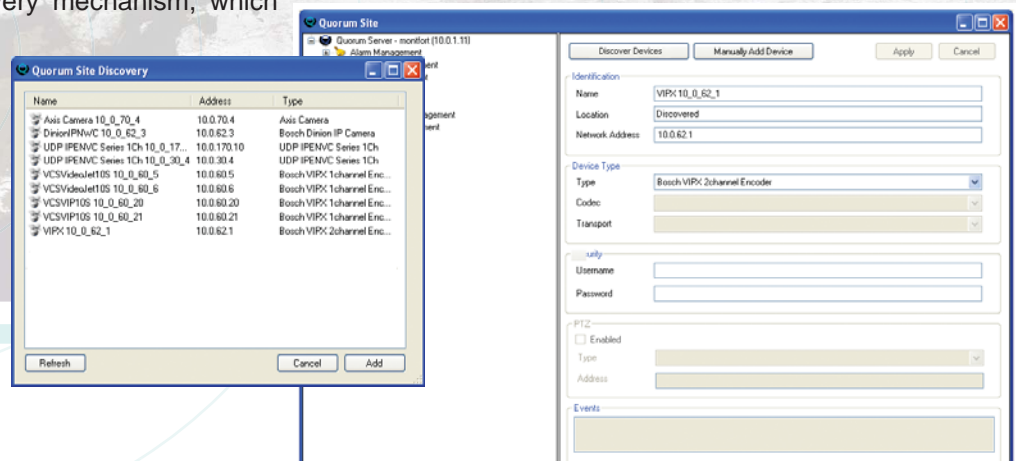

### Site Backup and Restore

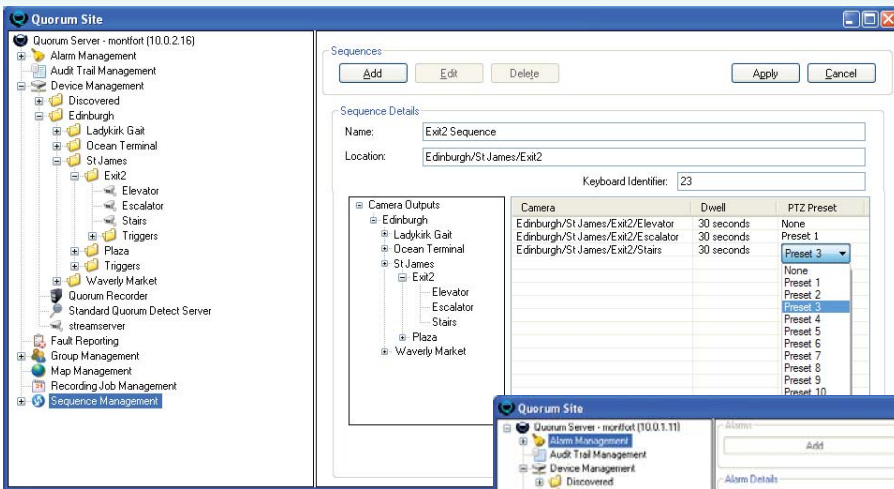

Quorum Site's configuration data can be backed up. If data corruption or PC problems occur, a working system can easily be restored from the configuration backup.

Alternatively, configuration backups can be used to copy configuration from one server to another.

The following configuration data is backed up:

- User names and groups.
- Devices.
- Recording jobs and partition details.
- Mapsets.
- Sequences.
- Complex alarms.

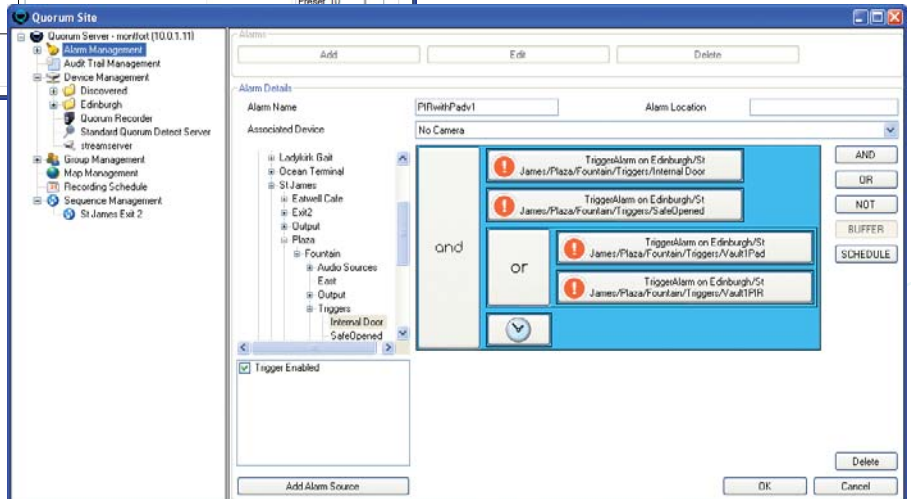

## Sequences

Add cameras to a sequence to display them in a continuous loop using the Quorum Pro Client application. You can specify how long each camera should be displayed on screen before the next appears. Key cameras can be added to a sequence more than once, ensuring that no incidents are missed.

## Complex Alarm Creation

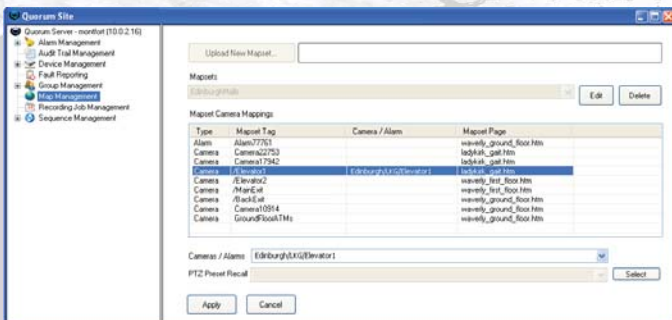

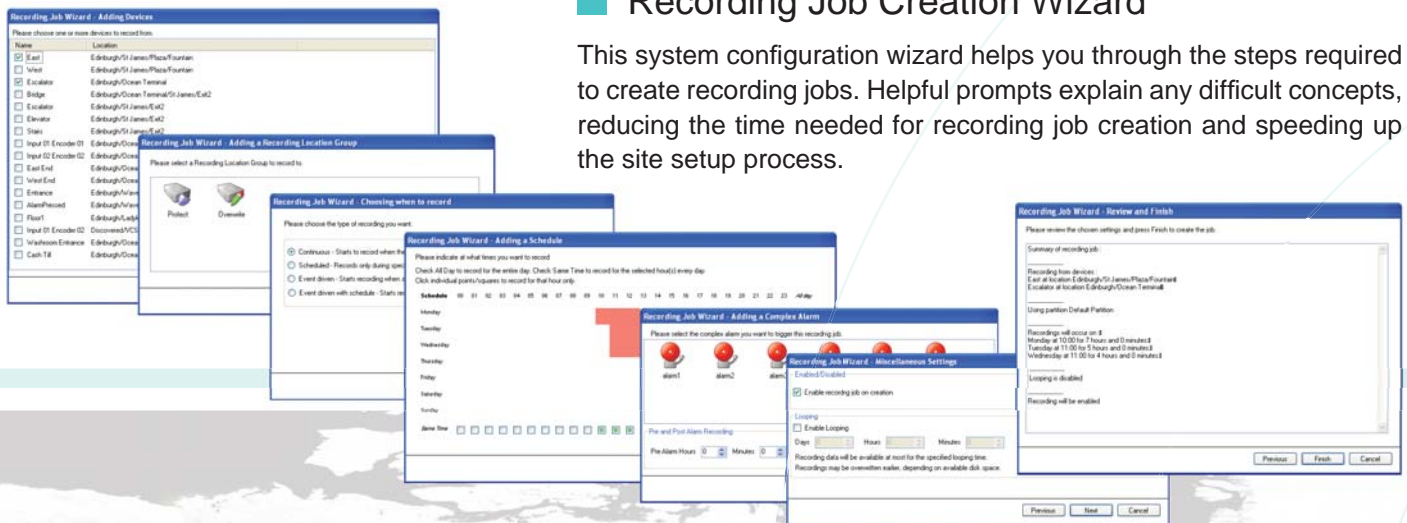

Complex alarms can be created by combining simple alarms and time schedules to form more complex alarm processing logic. An intuitive visual interface makes this easy to create and manage.

Parts of existing complex alarms can be copied and pasted into new alarms, reducing errors and speeding up the time spent on system setup.

## Recording Job Creation Wizard

This system configuration wizard helps you through the steps required to create recording jobs. Helpful prompts explain any difficult concepts, reducing the time needed for recording job creation and speeding up the site setup process.

## Mapset Integration

Quorum Site allows users to visualise surveillance sites by adding maps of monitored areas. Maps can initially be created with Quorum Design, or manually using Windows Notepad, then uploaded using Quorum Site.

These maps can then be imported into Quorum Pro Client, providing a visual representation of the areas to be monitored.
